- Operate in any situation: online or offline
- Inputs: manual, automatic, photos, barcodes, gps, ...
- Printer form

Direct input in a to de constitution and extract extra

#### **Advantages:**

WYSIWYG

Printer friendly

#### **Limitations:**

- Embedding code in documents, whether PDF or DOC
  - is neither safe nor reliable
    - Validations issues
    - Difficult automatic behaviour
- Tablet/smartphone UX issues for some people

"Native"

### **Advantages:**

- Quick data input
- Validations on the fly
- Usage of automatic actions while filling it

Address

Telefon

some value

#### **Limitations:**

Not printer friendly

Flexibility is the keyword ... so, we must find a way to have the best of the two worlds

## Solution: two views

### **FORM VIEW**

The user should be able to alternate between the two at any time. So, he can choose whatever he feels more comfortable.

The **Form View** is more adequate for PC or large Tablets and the **List View** for Small Tablets and Smartphones.

### **LIST VIEW**

## **FORM - Views**

Forms are created in the Form View (This view also corresponds to the print view)

The List View is automatically created (the "designer" only needs to adjust the sections and the order of the fields)

- Three ways to build a form:
  - From scratch
  - Use the existing forms as raster images and add the editables on top
  - $^{\triangleright}$  Importing: DOC  $\rightarrow$  XML  $\rightarrow$  JSON

Directly from a database:

Uses the field's metadata to automatically determine the type, length, max size and other sets and validations.

Manually:

And then associate the field to a database field.

 Using raster images to reuse existing paper forms or as a quick way to have a form done:

Section 4

# Database and Storage

#### Data sources:

- → Remote
  - Depends on network connection
- → Local
  - Forms ~ tables --- forms can have data tables associated it them, which can be used for local queries, for populating options/lists and more.
  - Independent of the network status

## **Validations**

- Both in the server and in the client
- Examples:
  - Max length: 20 characters
  - Phone number pattern: xxx-xxx-xxx
  - Required
  - >

# **Events/Actions**

 For automatizations: filling, enable/disable fields, show/hide stuff, usw.

#### **Events**

on accept / fill on delete on change on open form on close form on select (focus) on deselect on save on transfer

#### **Actions**

enable disable show hide check uncheck query remote query local

# **Events/Actions**

- Examples:
  - > On open form → set current date/time
  - $\rightarrow$  On option 1 checked  $\rightarrow$  hide section X
  - $\rightarrow$  On ID or name filled  $\rightarrow$  remote query A005

name address country postal code phone e-mail
